

**Abstract Of The Disclosure**

An apparatus is provided for the adaptation of a container of  
artillery rockets to a launcher apparatus for such rockets. A box-like  
5 launcher frame is disposed on a support structure, especially a vehicle  
chassis, and is pivotable in elevation and azimuth. At least one  
container, which has a right-angled cross-section and contains a  
plurality of artillery rockets, is adapted to be inserted from one end into  
the launcher frame. At least one adjustment module in the form of an  
10 essentially rectangular flat panel is provided. For a container having  
outer dimensions smaller than inner dimensions of the launcher frame,  
the adjustment module is disposable on the upper side and/or the  
underside of the container and is securable thereto. The outer  
dimensions of the adjustment module are such that when an  
15 adjustment module or modules are disposed on the container, the unit  
formed thereby has outer dimensions that correspond to the inner  
dimensions of the launcher frame.
